Course SI 100: How the Drug Discovery Industry Works

Course outline

This popular one day course is held at Emmanuel College, Cambridge (or in-house by arrangement). It describes how drug discovery is undertaken in the modern pharmaceutical and biotechnology industries, using case histories to illustrate key points. Technical jargon is clearly explained, with no prior knowledge assumed on the part of the delegates.

Delegate profile

Delegates from a wide variety of backgrounds who work with the drug discovery industry; these include new staff within the industry itself, personnel in university technology transfer departments, recruitment organisations, translation companies, sales and marketing professionals as well as legal and financial firms. The course also provides background information for journalists who cover healthcare issues in the media.

Trainers

Our trainers have many years' practical experience in research and development for major pharmaceutical companies; they are also experienced in communicating technical information to a wide audience of both specialists and non-specialists.

Testimonials

"There is nothing else like this on offer for informing non science-trained personnel. Too many courses, including e-learning and web searching, rely on some pre-knowledge, often approaching degree level; as a result we arranged for in-house courses to be delivered to our entire technology transfer admin team" Technology Transfer Manager, Medical Research Council, London.
